                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia salmonis The method comprises administering an immunogenic amount of a particularly polkilothermic fish, against the bacterial pathogen for protecting animals. The method is used for protecting animals sequence represents DNA with a News) and other rickettsial septicaemia (SRS) and other rickettsial diseases. The period is also useful for protecting against salmonid sequence represents DNA with has been optimised for expression in Escherichia coli to encode the p. salmonis ospa protein. An ospa protein anti-ospa antibody resnonse.

                                                                                                                            This invention relates to a method for the protection against infection of a poskilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method is used for protecting animals, particularly poskilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial pathogen sequence represents P. salmonis OspA DNA termed (JPE2 optimised for N-terminal fusion partner. The protein one mended by this fusion construct is used in a vaccine to create an anti-OspA antibody response.

The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the
                                                                                                                      Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis -

This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present

                                                                                                  This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a particularly poikilothermic fish, against the bacterial pathogen animals. The method is also useful for protecting animals, rickettsial septicaemia (SRS) and other rickettsial gazinst salmonis sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the

                                                                                                                                                                                                                                                                                  salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CA2281913-A1

The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (KAYW/)

                                                                                                                                                                                                                                                                                                                                                                                     CC The invention relates to human nucleic acids (AAI57798-AAI61369) and CC the encoded polypeptides (AAM38642-AAM42213) with nootropic, CC immunosuppressant and cytostatic activity. The polynucleotides are useful CC in gene therapy. A composition containing a polypeptide or polynucleotide CC system, such as peripheral nervous injuries, peripheral neuropathies and central nervous system diseases. CC lateral sclerosis, and shy-Drager Syndrome. Other uses include the CC lateral sclerosis, and shy-Drager Syndrome. Other uses include the activity, chamcatchic/chemokinetic activity, haemostatic/chemokinetic activity, haemostatic/c and thrombolytic activity, cancer diagnosis and therapy, drug screening, CC c.N.S disorders.

The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of

Subregions coding for the extracellular domain, optionally also with the cytoplasmic domain, can be amplified by PCR (see AAT66966-69), cloned into appropriate vectors and used for large-scale prodn. of AGPR derivatives (see AAW165251-52), free of contaminating liver antigens, in bacterial (pref. E. coli) or animal (pref. mammalian) host cells. Such AGPR (L-H2 derivatives can be used in a claimed method for detecting or measuring anti-AGPR antibody. AGPR H12 cDNA has also been cloned (see AAT66950).
                                                                           Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful treating acne vulgaris -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (II) (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences. AAS4197-AAS94564 represent novel human Note: The sequence data for this patent dia not appear in the printed are the wine intermed and in electronic format directly from WIPO are the intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermed and interesting intermediation.

CC This cDNA sequence codes for the p120 catalytic subunit (see CC ahw22948) of pig G-protein regulated phosphatidylinositol-3' kinase, CC a heterodimeric enzyme which produces the intracellular messenger CC phosphatidylinositol (3,4,5)-triphosphate in response to activation CC of trimeric G protein-linked receptors. This novel protein, which CC also contains a regulatory subunit, p101 (see AAV04633), is found in CC cells of haematopoietic origin and is involved in immune system CC pig neutrophil cDNA library using a degenerate oligonucleotide protein (see AAT99713) based on an isolated p120 tryptic peptide. The CC probe (see AAT99713) based on an isolated p120 nucleotides, CC invention encompasses pig and human p101 and p120 nucleotides, CC (invention encompasses pig and human p101 and p120 nucleotides, CC (awa23946-49), fusion proteins, p0101 and p120 proteins (see CC disorders can be identified by screening assays using a G protein CC compounds which are useful for treating inflammatory response CC disorders can be identified by screening assays using a G protein CC gene. Antagonists of G protein stimulated p13K (acting through the CC p101 subunit, especially by disrupting the interaction between the CC p101 subunit, especially by disrupting the interaction between the CC shock, adult respiratory distress syndrome (ARDS), pneumonia, CC asthman, allergies, reperfusion injury, atherosclerosis, cancer and CC Alzheimer's disease. The nucleic acids and their products can also be used for diagnosis, drug screening and clinical trial monitoring CC of inflammatory diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; TT:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         On Aug 9, 2001 this sequence version replaced gi:14787245. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Group.
